

PROJECT TITLE:

Mood Tracker and Personal Growth Assistant

➤ First Day Project Report

On the first day of our project,

Danial focused on the methodology research for implementing the mood tracker. His work involved exploring various techniques to analyze and categorize user emotions, ensuring that the system would accurately reflect the user's emotional state over time. This research is crucial in establishing the core functionality of our project.

Ayesha Liaqat took responsibility for identifying and outlining the features we will include in the application. She worked on defining the essential functionalities and user experience enhancements, such as mood improvement suggestions and goal tracking. Her efforts ensure that our project will provide comprehensive solutions that cater to user needs and effectively resolve potential challenges.

Eman Zeb conducted thorough research on the tools and techniques that will be used throughout the project. She explored the coding practices and technologies that align with our objectives, ensuring that we are equipped with the right resources to implement the project efficiently. Her work has laid the groundwork for our technical development as we move forward.

Together, the team has established a solid foundation for the project, setting clear directions for the next steps
